Table of contents

Aegon UK's Task Force on Climate-Related Financial Disclosures product level reports

Overview	3
How climate change is likely to impact the assets held by our funds	5
More information about the metrics we use	6
Table 1 – Fund metrics of exposures	8
Table 2 – Funds with no reportable data in this period	93

All data as at 31 December 2022 or 31 December 2023 unless otherwise stated.

All data sourced from MSCI unless otherwise stated.

If you'd like a large print, Braille or audio version of this document, you can contact us at aegon.co.uk/support/additional-support. We're always here to help if you need some additional support from us.

The value of investments can fall as well as rise and isn't guaranteed. You may get back less than you invest.

Overview

Purpose of the document

This document provides climate-related financial disclosures for our funds, in line with the Financial Conduct Authority (FCA) Environmental, Social and Governance (ESG) Sourcebook.

Default funds

Our workplace default funds use lifestyling or different target date funds depending on how close members are to retirement. The metrics and information in this report are provided in relation to the growth phase of the lifestyle process which is the most representative member profile for our default funds.

Our default funds work by automatically switching a member's portfolio into typically lower risk assets as they approach retirement. For example, during the early years (the growth phase) a member will be mainly invested in equities (company shares). Whereas a member approaching retirement will typically be mainly invested in fixed income and similar asset types with a smaller amount invested in equities.

This means the climate profile will vary depending on where a member is in their journey towards retirement. For example, funds with higher allocation to equities are likely to have a higher carbon footprint compared to a portfolio with a higher allocation to fixed income, as is the case for members approaching retirement.

Governance, Strategy and Risk Management

Aegon UK's overarching approach to Governance, Strategy and Risk Management also applies across our product range, except for our default funds where we have net-zero commitments and a climate strategy. You can find more information about this in the [Aegon UK TCFD entity report](#).

We set out our vision for decarbonising our default investment strategies in our net-zero transition plan, [our climate roadmap](#).

Climate Metrics

In table 1, we provide the key climate metrics that feed into our assessment of climate-related risks and opportunities across our funds, where climate data is available. More information and explanation around how these metrics should be understood, and their limitations, is provided on page 7 and is also available in Aegon UK TCFD entity report.

Climate data and reporting of financed emissions is more established for listed equity and corporate fixed income, and we have provided climate metric data for funds primarily invested in these asset classes.

In table 2, we list the funds we can't provide metrics for in this reporting period because data has not been shared with our data provider, or the data for the asset class held is limited or not available (for example, sovereign debt and property). We will continue to engage with our data providers and asset managers to help improve the availability of data.

We recognise that methodologies to measure carbon emissions in investments and associated climate-disclosure requirements are evolving quickly. As a result, we expect that the data and the number of funds we report on will increase in the next few years, in line with regulations and market best practice.

Exposure to carbon intensive sectors

We use the Global Industry Classification Standard (GICS) to define sectors. GICS is an industry-wide classification method developed by MSCI and S&P Dow Jones to provide consistent and comprehensive industry definitions. We have identified the following carbon intensive sectors and industry groups that significantly contribute to our funds' emissions:

- **Materials:** All industry groups, and industry sub-sectors.
- **Energy:** All industry groups, and industry sub-sectors.
- **Consumer Discretionary:** Automobiles and Components industry group; Consumer Durables and Apparel industry group.
- **Consumer Staples:** Agricultural Products & Services sub-industry.
- **Industrials:** Construction and Engineering industry; Air Freight and Logistics industry; Passenger Airlines industry.
- **Information Technology:** Technology Distributors sub-industry; Electronic Manufacturing Services sub-industry.
- **Financials:** Consumer Finance industry.

We consider a fund to have a concentrated exposure if it has more than 25% of its value invested in the sectors listed, industry groups or industry sub-groups. The funds that have been identified as having a concentrated exposure to carbon intensive sectors are identified in table 1 by a 'Yes' in the column headed 'Carbon intensive sectors'. Funds listed in table 2 can't be identified as having a concentrated exposure to carbon intensive sectors as we don't have the necessary data to perform this analysis. Therefore, these funds are not included in this assessment.

Impacts of climate change

We expect the economy moving towards net zero will have important implications for all asset classes held across our funds. We have used the results from our climate scenarios to provide a qualitative (research based) summary of how climate change is likely to impact the assets held by our funds under an 'orderly transition', a 'disorderly transition' and 'failed transition' scenario.

Significant drivers of impact on funds

The impact of climate change on different asset classes is complex and the drivers can affect asset classes differently.

However, the significant drivers of impact across all our funds (including those funds listed in table 2 that we cannot provide data for at this time) are generally the same and are grouped under three broad headings:

- **Physical risk** - the risk coming from changes in the weather system linked to climate change, for example temperature and precipitation changes. Also, the frequency and severity of extreme weather events, which can lead to financial losses and damage to physical assets. Physical risks can be both acute (event driven) and chronic (long term) in nature.
- **Transition risk** - the risk arising from the changes required to support the transition to a sustainable, low-carbon economy, including those driven by policy and technology changes.
- **Liability risk** - the risk that individuals or businesses seek compensation for losses suffered from the effects of physical or transition risks for which they hold organisations responsible. Liability risk is considered a subset of both transition risk and physical risk.

Whilst the transition to a low-carbon economy and the impacts of climate change will impact the entire economy and all sectors, it is reasonable to expect that carbon-intensive sectors may experience more physical and transitional risks^{1&2}.

Impact assessment models and analysis are still developing and we believe it would be misleading to make any detailed statements on specific drivers at a fund level, whilst we continue to work with our data provider to validate the underlying models.

1 The 4 Main Drivers of Transition Risk, and Why the Risks Are Increasing (garp.org) (Global Association of Risk Professionals | GARP), published April 2022, accessed May 2024

2 IIGCC Investor Expectations of Companies on Physical Climate Risks and Opportunities Sept2021.pdf (hubspotusercontent-eu1.net) (IIGCC - The Institutional Investors Group on Climate Change), published September 2021, accessed May 2024

How climate change is likely to impact the assets held by our funds

This section considers how climate change is likely to impact the different assets classes held across our funds. This qualitative summary applies to all our funds, including those we are unable to provide quantitative data for, at this time. In the future we plan to develop a process to provide a qualitative summary for each fund.

Asset class	Orderly transition	Disorderly transition	Failed transition
	<p>The orderly transition scenario assumes climate policies are introduced early and become gradually more stringent, reaching global net zero CO₂ emissions around 2050 and likely limiting global warming to below 2°C on pre-industrial averages. Physical risks are likely to increase gradually over time.</p> <p>In an orderly transition scenario, we expect that equities held across our investment estate would be impacted from transition-driven effects in the short term, with physical risks expected to gradually increase later. The impact on equities under this scenario is unlikely to be the same across all sectors or regions, and the impact on each fund will be dependent on the specific assets held, the country and sector allocation.</p>	<p>The disorderly transition scenario assumes climate policies are delayed or divergent, requiring sharper emissions reductions achieved at a higher cost and with increased physical risks in order to limit temperature rise to below 2°C on pre-industrial averages. Physical risks are likely to increase.</p> <p>In a disorderly transition we expect there would be a delay in market adjustments. Based on our analysis of equities held across our investment estate, we estimate that the delayed market adjustments will have a large impact across all regions. The impact would be mitigated later with a partial recovery in the markets, however additional physical impacts would reduce long-term returns over time.</p>	<p>A failed transition scenario assumes only currently implemented policies are preserved, current commitments are not met, and emissions continue to rise, with high physical risks and severe social and economic disruption. There is a failure to limit temperature rise.</p> <p>In a failed transition scenario, our analysis of equities held across our investment estate suggests that the entire asset class would be affected by delayed market adjustments. In the short term, the impact on equities is not expected to be material. This is because market adjustments would occur much later, as there is no transition event in this scenario. However, it is unlikely that transition opportunities are realised, and equities will be impacted by physical and extreme weather impacts.</p>
Listed Equity			
Fixed Income	<p>In the short term, interest rates in the UK, and most other countries, would not be materially impacted due to limited climate-related impacts on growth in the orderly transition scenario. Similar to listed equities, the impact under this scenario is unlikely to be uniform. Based on analysis of our fixed income assets held across our investment estate, we estimate that UK and European corporate bonds are resilient against climate risks but US and Asian corporate bonds less so.</p>	<p>Under a disorderly transition scenario, analysis across our fixed income investment universe suggests that yields would be impacted in the same way as under the orderly transition scenario. In the medium term, interest rates may go down slightly. A gradual decline in yields could impact fixed income returns. There may be some upward short-term movements of sovereign yields in the UK, which in turn may improve fixed income returns.</p>	<p>Under a disorderly transition scenario, analysis across our fixed income investment universe suggests that yields would be impacted in the same way as under the orderly transition scenario. In the medium term, interest rates may go down slightly. A gradual decline in yields could lead to positive fixed income returns. There may be some upward short-term movements of sovereign yields in the UK, which in turn may improve fixed income returns.</p>
Property	<p>Under an orderly transition, UK property would be largely affected by physical risks in the medium to longer-term. In the short term, any gains from transition risk are likely to be offset by losses from physical risks.</p>	<p>In the medium term, property may behave similarly to the orderly transition scenario. However, longer-term losses are likely to be materially higher in the disorderly scenario. Recovery could be offset by increasing physical risks.</p>	<p>Under a failed transition scenario, our analysis suggests that property would be significantly affected by market adjustments to valuations that would factor in physical damage to property.</p>

More information about the metrics we use

Here we explain some of the terms used in the metric tables below.

Absolute emissions metric - total greenhouse gas (GHG) emissions: This metric captures the absolute carbon emissions for corporate fixed income and equity assets across our investment estate. We report GHG in tonnes of carbon dioxide equivalent (tCO₂e).

tCO₂e: Tonnes of carbon dioxide equivalent (tCO₂e).

Scope 1 and 2 greenhouse-gas (GHG) emissions: Scope 1 emissions are direct GHG emissions that occur from sources owned or controlled by a company. Scope 2 emissions are indirect GHG emissions from the generation of purchased or acquired electricity, steam, heating or cooling consumed by the reporting company.

Scope 3 GHG emissions: All other indirect GHG emissions not included in scope 2 that occur in the value chain of the reporting company. Scope 3 emissions are typically more material than Scope 1 and 2.

Emissions intensity metrics:

Carbon footprint (tonnes CO₂e/£M EVIC) (corporate fixed income and equity): Carbon footprint is a measure of the total greenhouse gas emissions caused by the companies we invest in. It is the level of collective greenhouse gas emissions generated by the companies in which your pension invests and measures how many tonnes of emissions are being financed per £1 million invested. This figure is called Enterprise Value Including Cash (EVIC).

Weighted average carbon intensity (tonnes CO₂e/£M revenue) (corporate fixed income and equity): This metric measures a portfolio's exposure to carbon-intensive companies by revenue, expressed in tonnes CO₂e/£m revenue. Emissions are allocated based on portfolio weights (the current value of the investment relative to the current portfolio value).

Data quality: This metric shows the percentage value of scope 1 and 2 emissions that are reported, estimated or unavailable.

Implied temperature rise (degree Celsius): This is a forward looking metric and gives an indication of how much the global temperature would increase if the global economy had the same carbon output as our investment estate. We're including this metric to show the extent to which our investment estate and portfolio of default funds are aligned to a well below 2°C scenario.

Climate Value-at-Risk (CVaR): CVaR is a forward-looking assessment of the potential financial impacts of climate risks and opportunities on our investment portfolios under different transition scenarios. We show CVaR under the following three scenarios:

1.5°C orderly transition: An orderly transition assumes that policy makers introduce changes gradually, giving companies time to adapt their business models.

2.0°C disorderly transition: A disorderly transition assumes a sudden change in legislation dictated by an urgent need to change business practices and social behaviour.

4.0°C failed transition: A failed transition assumes a slow and limited decarbonisation of the electricity generation mix in 2030, with further progress limited. Carbon capture and storage uptake is low and late, and emissions never reach net-zero.

Data limitations

We have established systems and processes to gather climate data and relevant insights to help guide our climate strategy. We get climate metrics and scenario analysis for our funds from data providers but remain mindful of key limitations to current data. These limitations are set out below:

- Climate data and reporting of financed emissions is more established for listed equity and corporate fixed income, and we have reported metrics for funds that include these asset classes. We have been able to report data for sovereign debt at entity level but we are not yet in a position to provide sovereign debt metrics at a fund level due to data access limitations. We expect to report sovereign debt at fund level in our next TCFD report, to be published in 2025.
- As an indirect investor, we are unable to obtain data for all of our investments because data has not been shared with our data provider, or the data for the asset class held is limited or data is not available (for example, sub-sovereign debt and property). We have not used any proxy data in place of unavailable data as we believe this could lead result to misleading metrics.

- Whether reported or estimated, the quality of emission data is inconsistent:
 - MSCI do not verify emissions data, and their estimated emissions are based on companies within a sector that self-reports. Consequently, there may be some inaccuracies in the reported emissions data used to calculate metrics, due to a lack of industry-wide company emissions auditing and regulation.
 - We acknowledge that reliable scope 3 emission reporting will not be widespread in the near future. While the disclosure of scope 3 emission data is improving, there are differences in what similar sector companies report on, what a single company chooses to include in their reported emissions from one year to another, and how complete the scope 3 emissions are. We are exploring the development of MSCI's new scope 3 combined methodology to leverage the best of both reporting schemes and estimation models, and help improve confidence in our scope 3 reporting.
 - Limitations specific to scenario analysis are addressed in the Strategy section of our entity report.

In summary, we recognise that the methods used to measure carbon emissions in investments and associated climate-disclosure requirements will evolve. We expect that the data we report may change in the next few years, in line with regulations and market best practice.

We'll continue to work with our fund managers and data providers to help improve the data we have access to, ultimately driving our climate insights and decision-making. You can find out more about this in our case study 'Engagement and collaboration with MSCI' in our [TCFD entity report for 2023](#).

Appendix

Table 1 – Fund metrics of exposures

Fund Name	Year	Absolute emissions metrics			Emissions intensity metrics				Data quality			Portfolio alignment metric	Carbon intensive sectors	Scenario analysis
